

MQTT and Node-RED and the Internet of Things

Kirk Carlson
Retired – long time Unix/Linux user
Kirk.Carlson@att.net
github.com/kirkcarlson

MQTT

- Message Queueing and Telemetry Transport
- Invented at by Andy Stanford-Clark (IBM) and Arlen Nipper (Cirrus Link) in 1999.
- A light weight protocol for telemetry and control
- While queuing is historically significant, it isn't necessary for the Internet of Things

MQTT Node Types

- Client
 - Is an end point that produces or consumes messages
- Broker
 - Acts as a hub to accept and distribute messages
 - Each client typically connects to one broker
 - A broker can connect to many clients

MQTT Operations

- Uses a Publish-Subscribe or Pub-Sub model
- Data producers publish data to a broker
- Data consumers subscribe to data from a broker
- There is some overhead to establish and release the connections to a broker so connections are normally long lived.

MQTT Common Operations

- CONNECT
- CONNACK
- PUBLISH
- SUBSCRIBE
- SUBACK

MQTT Less Common Operations

- PUBACK, PUBREC, PUBREL, PUBCOMP
- UNSUBSCRIBE
- UNSUBACK
- PINGREQ
- PINGRESP/PING
- DISCONNECT

MQTT PUB Encoding Basics

- Topic (UTF-8 string, no wild cards)
- Payload (string, integer, JSON, etc.)
- Quality of Service--QoS (0, 1, or 2)
- Retention flag (yes, no)
- Duplicate (0 initial transmission, 1 repeat)

MQTT SUB Encoding Basics

- Payload is list of topics, may use wild cards
 - ‘+’ is a wild card to select a single level
 - ‘#’ is a wild card to select one or more levels
 - A wild card is the only character allowed on a level
 - A ‘#’ must be the first or last level
- Payload must be UTF-8 encoded string
- Requested QoS (0, 1, or 2) for subsequent broker publishes to client

MQTT topic

- Just a UTF-8 string of characters
 - *except '+' and '#'*
- Can be free form, although local rules facilitate wild card use
- Current practice uses slashes to delimit levels of a hierarchy to structure the data

Topic Examples

- `nodename/temperature/unit/value`
- `nodename/humidity/unit/value`
- `nodename/heartbeat`
- `#/value` gives all values
- `nodename/#` gives everything from node
- `+/temperature/#` gives all temperatures from all nodes
- `#/heartbeat` give heartbeat from all nodes

MQTT Payload

- Variable length
- Format is application specific
- Strings and integers are easy
- A string can be JSON for more complex data

Quality of Service – QoS

- QoS 0: At most once or “fire and forget”
- QoS 1: At least once
 - Message is sent until message ID ACKed
 - Message may be duplicated
- QoS 2: Exactly once
 - Message is sent until message ID is RECed
 - ID is kept by receiver until ID is RELEd
 - ID is kept by sender until ID is COMPed

QoS 0 Message Sequence

QoS 1 Message Sequence

QoS 2 Message Sequence

Node-RED

- “They” call it an event wiring tool
- It is based on nodes and connections
- Focused on message flows
 - When a message arrives, do something with it

Implementation

- Node-RED has been part of Raspbian for some time
- Built with JavaScript on Node.js
- It is accessed with a browser
- Easy install procedure for Debian and Ubuntu

Using Node-RED

- It is extended with node npm modules
 - Raspberry Pi GPIO
 - Node-RED-Dashboard ***MUST HAVE***
- Flows, the user source code, may be shared as JSON which carries the graphic information, attributes, and interconnections

What is a Node?

- Something that manipulates a message
- Could be an MQTT endpoint
 - publisher or subscriber
- Could be a function to transform messages
- Could be just about any event producer
- Could be just about any event consumer

Simplest Node-RED Demo

- Two Nodes
 - An injection node
 - A debugging node
 - Just prints what it receives on the debugging window
- Configure
 - Change injection node topic to “message/first”
 - Change injection node payload to “Hello World”
- Deploy – compile into JSON and JavaScript

Add nodes and connect

The screenshot shows the Node-RED web interface. On the left, the 'input' and 'output' node palettes are visible. In the center workspace, a workflow is being built on a grid. The workflow consists of four nodes connected in sequence: an 'inject' node (blue), a 'debug' node (green), a 'timestamp' node (blue), and a 'msg.payload' node (green). Three numbered annotations with arrows point to the nodes: '1. Drag "inject"' points to the inject node, '2. Drag "debug"' points to the debug node, and '3. Connect nodes' points to the connection between the timestamp and msg.payload nodes. On the right, the 'info' sidebar is open, showing 'Information' for the selected nodes, indicating '8 nodes' are selected. At the bottom right, a message states: 'Pressing `enter` will edit the first node in the current selection'.

Node-RED interface showing a workflow with the following nodes and connections:

- Input Nodes:** inject, catch, status, link, mqtt, http, websocket, tcp, udp, serial, Watson IoT.
- Output Nodes:** debug, link, mqtt, http response, websocket, tcp, udp, play audio, serial, Watson IoT.

Workflow steps indicated by annotations:

1. Drag "inject"
2. Drag "debug"
3. Connect nodes

Information sidebar shows: Selection 8 nodes

Pressing `enter` will edit the first node in the current selection

Configure Inject

The screenshot displays the Node-RED web interface. On the left, the 'Input' node palette is visible, containing nodes like inject, catch, status, link, mqtt, http, websocket, tcp, udp, serial, and Watson IoT. The main workspace shows a flow with an 'inject' node. The 'Edit inject node' dialog is open, showing the configuration options. The 'Payload' dropdown is set to 'timestamp', and a context menu is open showing options: 'flow.', 'global.', 'string', 'number', 'boolean', 'JSON', 'buffer', 'timestamp', and 'env variable'. The 'Repeat' section is set to '0.1 seconds, then'. The 'Name' field is empty. A note at the bottom of the dialog states: "Note: 'interval' should be used for 'at a specific time' will use cron. See info box for more details." The right sidebar shows the 'info' tab for the selected node, displaying its ID, type, and a detailed description of its functionality.

Information

Node "283918de.bd6618"

Type inject

Description

Node Help

Injects a message into a flow either manually or at regular intervals. The message payload can be a variety of types, including strings, JavaScript objects or the current time.

Outputs

payload various

The configured payload of the message.

topic string

An optional property that can be configured in the node.

Details

The Inject node can initiate a flow with a specific payload value. The default payload is a timestamp of the current time in milliseconds since January 1st, 1970.

The node also supports injecting strings, numbers, booleans, JavaScript objects, or flow/global context values.

By default, the node is triggered manually by clicking on its button within the editor. It can also be set to inject at regular intervals or according to a schedule.

It can also be configured to inject once each time the flows are started.

Hold down **i** when you **click** on a node to also select all of its connected nodes

Configure inject (continued)

The screenshot shows the Node-RED interface with the 'Edit inject node' dialog open. The dialog has a 'Properties' section with the following fields:

- Payload:** A text input field containing 'Hello World'.
- Topic:** A text input field containing 'message/first'.
- Inject once after:** A checkbox that is checked, followed by a numeric input '0.1' and the text 'seconds, then'.
- Repeat:** A dropdown menu set to 'none'.
- Name:** A text input field containing 'Name'.

Annotations with arrows point to the 'Payload' and 'Topic' fields:

- '1. Change payload' points to the 'Payload' field.
- '2. Change topic' points to the 'Topic' field.

A yellow note box at the bottom of the dialog states: 'Note: "interval between times" and "at a specific time" will use cron. "interval" should be less than 596 hours. See info box for details.'

The right sidebar shows the 'Info' panel for the selected node, displaying its ID ('283918de.bd6618'), type ('inject'), and a description of its functionality.

Deploy

The screenshot shows the Node-RED web interface. On the left, there are two panels: 'input' and 'output'. The 'input' panel contains nodes like inject, catch, status, link, mqtt, http, websocket, tcp, udp, serial, and Watson IoT. The 'output' panel contains nodes like debug, link, mqtt, http response, websocket, tcp, udp, play audio, serial, and Watson IoT. In the center workspace, a workflow is visible: a 'message/first:Hello World' node connected to a 'msg.payload' node. On the right, there is an 'info' sidebar with tabs for 'info', 'debug console', and 'debug console'. The 'info' tab is active, showing details for the selected 'msg.payload' node, including its ID, name, and status. At the top right of the interface, there is a red 'Deploy' button. Two arrows point to the 'Deploy' button and the 'msg.payload' node, with the following text:

1. See undeployed changes
2. Click "Deploy"

Below the 'info' sidebar, there is a message box that says: 'You can confirm your changes in the node edit tray with `ctrl-enter` or cancel them with `ctrl-escape`'.

Run it

The screenshot shows the Node-RED web interface. On the left, the 'input' and 'output' node palettes are visible. The main workspace contains a workflow with a 'message/first:Hello World' node connected to a 'msg.payload' node. On the right, the 'debug' window is open, displaying the output of the workflow. Three numbered arrows point to specific elements: 1. 'select debug window' points to the 'debug' tab in the top right. 2. 'click here to inject' points to the inject icon on the 'message/first:Hello World' node. 3. 'see debug output' points to the debug console output.

1. select debug window

2. click here to inject

3 see debug output

debug

```
6/8/2019, 5:35:09 PM node: 5b0886b.75cd78  
message/first : msg.payload : string[1]  
"Hello World"  
6/8/2019, 5:35:11 PM node: ed3c68b2.e0b418  
rotary1heartbeat : msg.payload : string[0]  
..
```

Simple Function Demo

- Subscribe to an MQTT message from a temperature sensor
- Send the payload to a MQTT display device
- Change the units from Celcius to Farhenheit

Dashboards

- Dashboards allow control access with browser
 - Make a button, slider, text input, color selector
 - Make a text display, gauge, chart
 - Make a noise
- Repeat and get creative

Status

Dead

Dashboard Example for Mobile

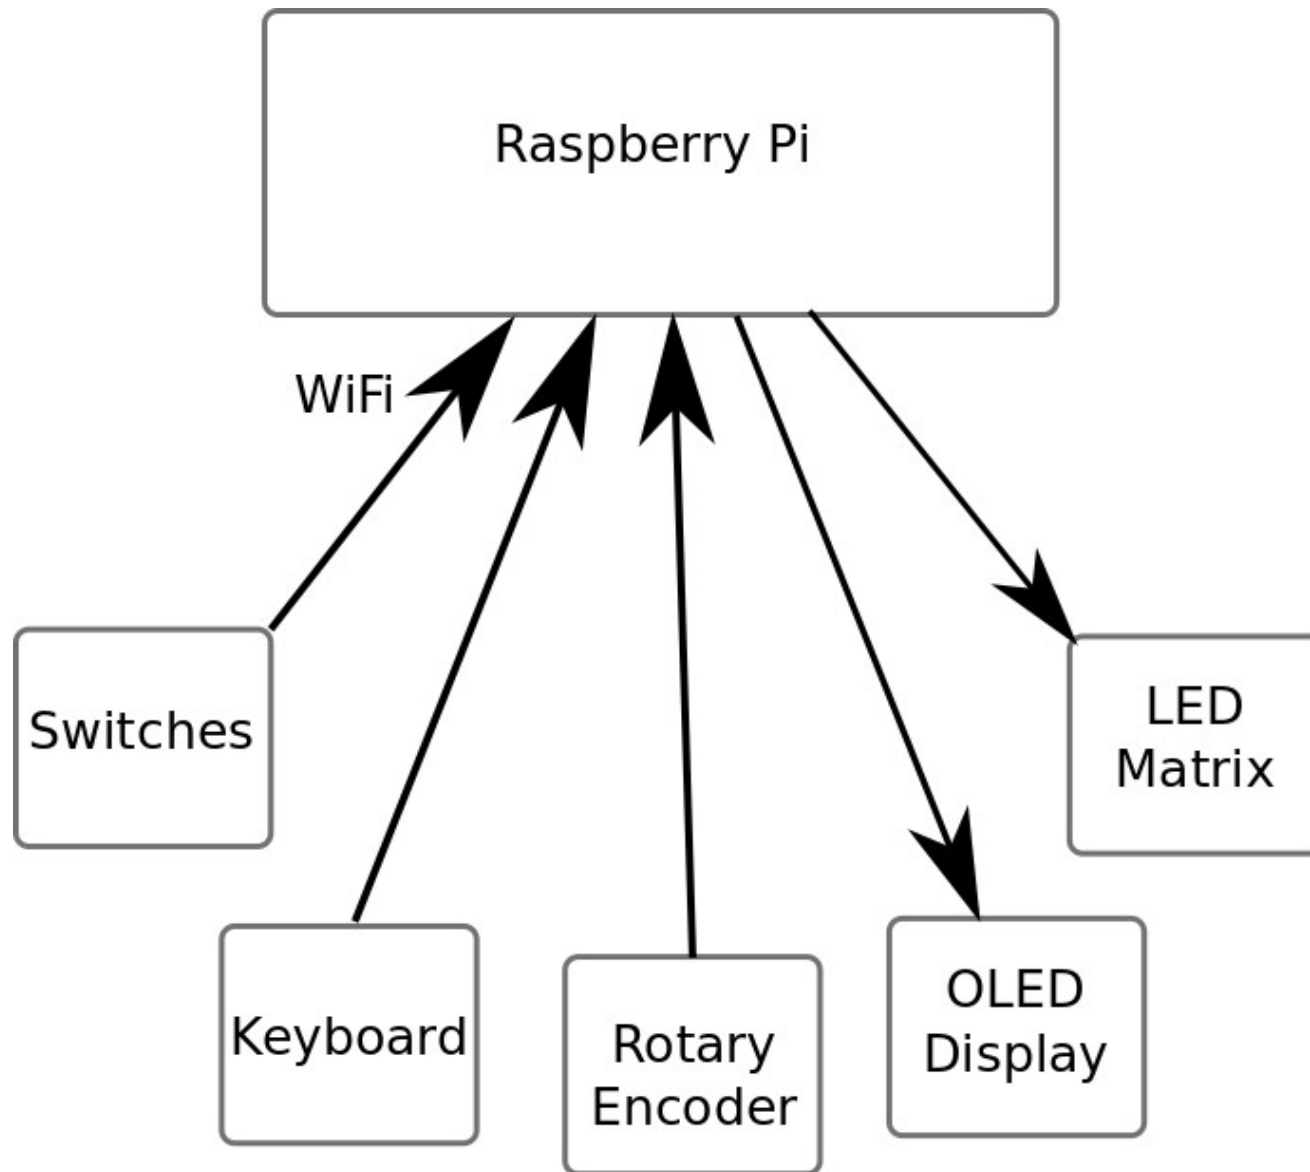

MQTT Demo

- Basic setup is for a STEM fair
- Flashing lights to attract the kids
- Interactivity to hold attention for a while
- Talk about computers, software, messaging, hardware, whatever is of interest
- Activity is based around Conway's Game of Life

Conway's Game of Life

- Count neighboring live cells (0-8)
- Alive and 0 or 1 live cells: die from isolation
- Alive and 2 or 3 live cells: live for another day
- Alive and 4 or more live cells: die from crowding
- Dead and exactly three live cells: become live
- Great waste of computer resources in 70's

Basic Setup of Demo

MQTT Demo (continued)

- Devices are generic and fairly dumb
 - *Using Particle Photons with particle.io disabled*
- Node-RED is used to connect devices
- Functionality implemented in Node-RED
- Dashboard created to allow remote control
 - Smart phone
 - Desktop browser

Raspberry Pi is Hub

- It is a WiFi access point
- It serves as the router and DHCP
- It is the MQTT broker
- It is the Node-RED server
 - Provides most of the functionality
- It is the dashboard server for a GUI

MQTT Security

- Default is ease of use, NOT security
- “Can” use TLS as part of TCP transport
- “Can” use password authentication
- Lots of vulnerabilities beyond this protection

MQTT Presence Detection

- Manually register nodes in Node-RED
- Do not accept requests from unknown nodes
 - Watch global subscriptions (“#/door”, “+/window”)
- Add a watchdog timer and heartbeat to nodes
 - Detect failing nodes (power, connection, ...)
- Report missing or failing nodes
- (MQTT connection protects link, not end-to-end)

Use Cases

- Collect and display sensor data
- Security system
 - Secure interfaces
 - Intrusion detection
 - Attack detection
 - Redundancy
 - power, comms, sensors, alarms, control
 - External monitor and reporting

Attack Surfaces

- Device to broker
 - WiFi denial of service
 - WiFi jamming
 - WiFi hijacking
 - Node impersonation
 - MQTT denial of service
 - MQTT jamming

Attack Surfaces (continued)

- Broker to Node-RED or vice versa
 - Denial of service
 - Impersonation (wrong nodes on authorized link)
 - Impersonation (publish commands on inbound links)

Attack Surfaces (continued)

- Broker to device
 - Impersonation (unauthorized commands)
 - Impersonation (wrongful acknowledge)
 - Denial of service (WiFi and MQTT)
 - Jamming (WiFi and MQTT)

Attack Surfaces (continued)

- Within Raspberry Pi
 - Intercept with false routes
 - Administer Node-RED
 - Inspect or replace Node-RED files
 - Inspect or replace node authorization files?
 - Inject messages to Node-RED
 - Subscribe to Node-RED feeds

Attack Surfaces (continued)

- Power
 - Power to the node devices
 - Power to the Raspberry Pi
 - Power to any required communication equipment
 - Primary power – grid?
 - Backup power – battery, generator, solar
 - Duration of backup

Attack Surfaces (continued)

- External Communication Links
 - Physically cut wires for phone, SDL, cable
 - Illegally jam cell phone
 - Illegally hijack cell phone
 - Denial of service on recipient
 - Denial of service on sender
 - Prior fake false negatives masking true positive
 - Improper redundancy provisioning

Attack Surfaces (continued)

- Node-RED-Dashboard
 - No native authentication
 - Either add something: password, auth token, ???
 - OR consider carefully what you expose

Attack Conclusion

- Wireless in general, WiFi in particular, sucks
- Wired solutions take more time
- Wired solutions are more secure
- Encryption secures link data
- Bi-directional authentication prevents hijacking and impersonation
- Need to separate Pi users and permissions
